

Juneau is an excellent place to view birds. Within a very localized area, one can visit a variety of habitats, including alpine, forest, and marine ecosystems. The very extensive network of trails provides access to spectacular valleys, glaciers, and ridgetops.

This checklist includes all species of birds, nearly 300 observed to date, along the Juneau road and trail system, and adjacent marine waters. The area encompasses the mainland from Point Bishop to Echo Cove, Douglas Island, and adjacent marine waters from the mouth of the Taku River to Berners Bay.

This publication is dedicated to the memory of Juneau resident M.E. "Pete" Isleib. Pete was Alaska's foremost birder, as well as a noted conservationist. He was an inspiration to those lucky enough to know him.

Gus van Vliet, Mark Schwan, Rich Gordon, Steve Zimmerman, and Paul Suchanek compiled and produced this checklist. Although much of the information stems from personal observations of the compilers, this checklist would not be possible were it not for the earlier work and records of the late Dr. Ralph B. Williams, and the published records and observations of many other individuals.

### SEASONS

**SP**ring: March 22 - June 21  
**BR**eeding: Nesting status in area  
**Sum**mer: June 22 - September 21  
**F**all: September 22 - December 21  
**W**inter: December 22 - March 21

Note that the seasons are defined by the solstices and equinoxes, even though some species breed in "Spring" and much of the fall migration (particularly shorebirds, flycatchers, and warblers) actually occurs during the last half of "Summer." Similarly, many of our wintering birds arrive in "Fall" and a number of spring migrants return to the Juneau area in late "Winter." The breeding status is meant to convey known or suspected nesting in the checklist area.

### ABUNDANCE

**C** = Common                      **R** = Rare  
**F** = Fairly common            **V** = Very Rare  
**U** = Uncommon                **+** = Accidental  
**O** = Occasional                **-** = No records

Abundance is based on the numbers of birds present in the area, not how often species are likely to be observed (See definitions on back cover). **Bold-faced** species are those that are most typically seen in the Juneau checklist area. This includes any species listed as common or fairly common in the checklist area during one or more seasons of the year.

**Steller's Sea-Eagle:** Although not confirmed for the checklist area, the adult Steller's Sea-Eagle that has resided in the Taku River Valley, near Juneau, has thrilled hundreds of birders from many parts of the continent. This individual bird, native to the Soviet Far East, has greatly increased interest in the diverse birding opportunities in and around Juneau.

Additional Notes:

#### Definitions for Categories of Abundance

- Common:** Occurs in essentially all suitable habitats during appropriate seasons, with certain species at times quite abundant; should be easy to locate.
- Fairly Common:** Occurs in some or most suitable habitats during appropriate seasons, but less abundant and at times few in number; often located.
- Uncommon:** Small numbers in suitable habitats and seasons; locatable.
- Occasional:** Very small numbers at least briefly in each year; may be very hard to find.
- Rare:** One or two presumed to occur in most years.
- Very Rare:** Same as casual; does not occur most years but may be expected to recur.
- Accidental:** Only one or two historical records.
